

Introduction

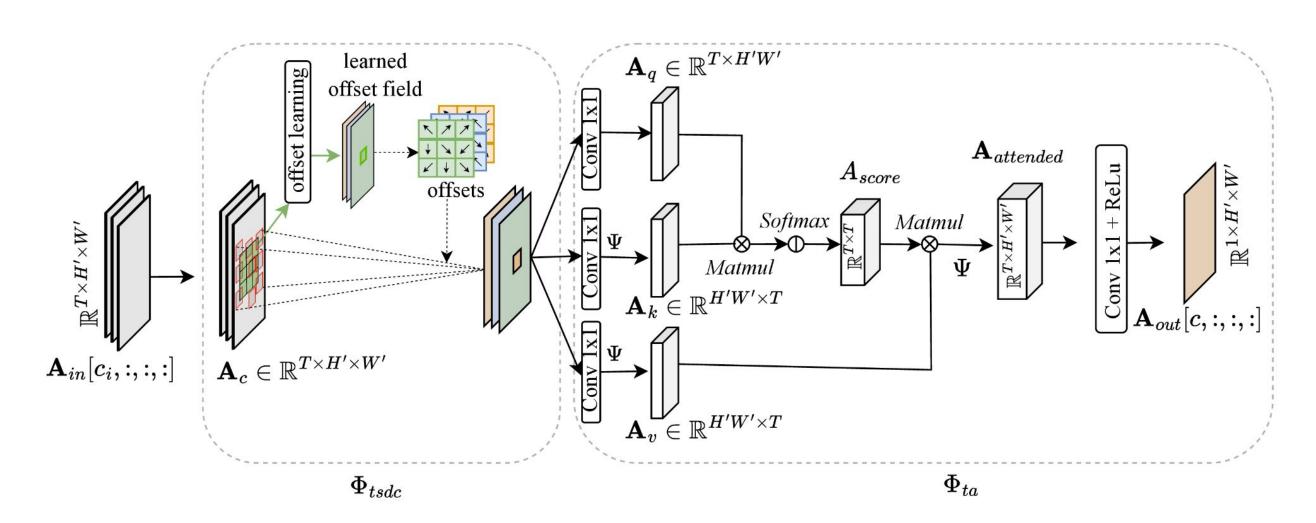

- Hybrid Event Object Detector: First hybrid SNN-ANN model for benchmark event-based object detection.
- β_{ASAB} Bridge Module: Attention-based module converting spikes to dense features via ERS and SAT.
- Multi-Timescale RNN: Combines fast SNN and slow DWConvLSTM for temporal feature learning.
- Neuromorphic Deployment: SNN blocks validated on digital neuromorphic hardware for efficiency.

Overall Network

• Architecture of the hybrid model featuring an object detection head and an SNN-ANN hybrid backbone, which includes the SNN block, the β_{ASAB} bridge module, and the ANN block. The DWConvLSTM modules and dashed blue arrows are specific to the hybrid + RNN variant.

Spatial-aware Temporal Attention (SAT)

- Channel-wise Temporal Grouping to group together temporally relevant features for better temporal understanding
- Time-wise Separable Deformable Convolution for spatial context, and
- Temporal Attention to translate temporal cues into spatial features.

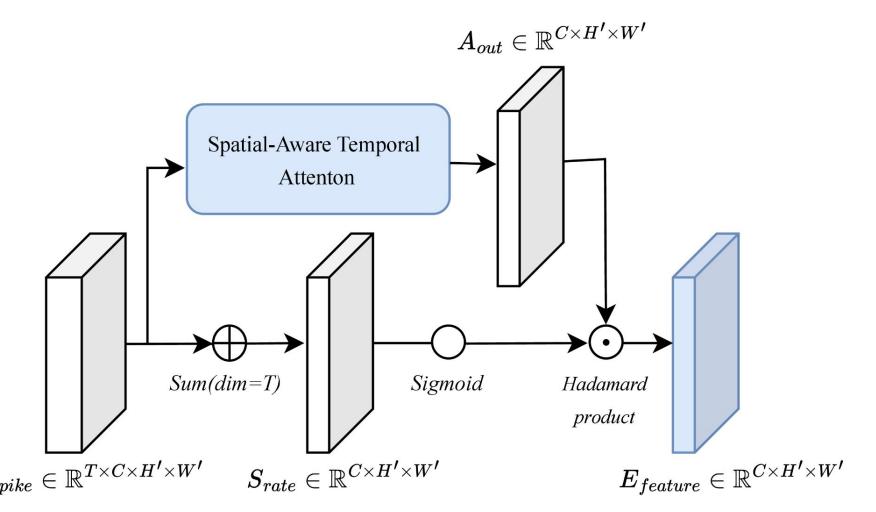

Efficient Event-Based Object Detection: A Hybrid Neural Network with Spatial and Temporal Attention

Soikat Hasan Ahmed^{*}, Jan Finkbeiner[†], Emre Neftci Forschungszentrum Jülich, RWTH Aachen University

Event-rate Spatial (ERS) Attention

- Computes event rates by summing spikes over the time dimension.
- scores.
- Uses these scores to weight the SAT module output via element-wise multiplication.

Datasets

- We train our hybrid network end-to-end using Prophesee Gen1 and Gen4 automotive event camera datasets.
- Gen1 (39 hrs, 304×240) and Gen4 (15 hrs, 720×1280) provide annotated events for cars, pedestrians, and two-wheelers (Gen4 only).

Proposed	Hybrid	6.6M	0.35

• The proposed hybrid model achieves higher accuracy than SNNs and matches ANN/RNN models with lower power and latency.

• Normalizes event rates using a sigmoid function to create spatial attention

Visual Results

• The SNN-blocks of hybrid model was deployed on Intel's Loihi 2 neuromorphic chip, leveraging its event-based architecture for

• Convolutional weights were quantized at different levels using a per-output-channel scheme, revealing negligible accuracy loss.

• Spike dynamics and BatchNorm were fused into LIF neuron behavior for efficient deployment, with q_{scale} as the quantization scaling factor and τ as

• An in-depth ablation study was conducted for each component of the proposed **ASAB** module, along with various configurations of the hybrid

From left to right: Without ASAB, With ASAB, and Ground Truth. The first three columns correspond to the Prophesee GEN1 dataset, and the last three to the GEN4 dataset
